## EXPLORING THE ENDOGENOUS AND EXOGENOUS PATHWAYS OF SOCIAL CAPITAL

This presentation seeks to understand the conceptual pathways associated with endogenous and exogenous social capital at the micro level. Social capital can be endogenous insofar as it originates from within social networks or exogenous insofar as it derives from sources outside of immediate social networks. The endogenous pathway to social capital shows how tangible, more durable relationships produce social capital, while the exogenous pathway shows how social capital arises in fleeting experiences among members of an imagined community. In fleshing out these social processes, the presentation aims to provide greater conceptual rigor to our understanding of how social capital forms and how social capital facilitates action.
